Description

The M74HC14 is a high speed CMOS hex Schmitt inverter fabricated with silicon gate C^2 MOS technology. Pin configuration and functions are the same as those of the M74HC04 but all inputs have a 20 % V_{CC} hysteresis level.

This, together with the Schmitt trigger function, allows the device to be used on line receivers with slow rise/fall input signals.

All inputs are equipped with protection circuits against static discharge and transient excess voltage.

C_{PD} is defined as the value of the IC's internal equivalent capacitance which is calculated from the operating current consumption without load (refer to test circuit). Average operating current can be obtained by the following equation:

I_{CC(opr)} = C_{PD} x V_{CC} x f_{IN} + I_{CC}/6(per gate).
